## FALL 2003 Midterm Exam \#3, Part A

Exam time limit: 50 minutes. You may use a calculator and both sides of TWO sheets of notes, handwritten only. Closed book; no collaboration. For multiple choice questions, circle the letter of the one best answer (unless more than one answer is asked for). Ignore gravity in all problems unless told otherwise, and ignore relativistic effects in non-relativistic problems.

$$
c=2.998 \times 10^{8} \mathrm{~m} / \mathrm{s}
$$

(1 point each, unless otherwise specified)

1. (4 pts.) Match each of the following descriptions to one term from the list at left (use each term NO MORE than ONCE or not at all):
$\qquad$ differing index of refraction for different wavelengths of light
A. birefringence $\qquad$ differing index of refraction for different polarization orientations
B. Brewster's angle
C. dispersion $\qquad$ the destructive or constructive addition of waves at the same point in space
D. diffraction
E. Huygens's principle $\qquad$ the orientation direction of the $\mathbf{E}$-field of an electromagnetic wave
F. interference
G. Malus's Law $\qquad$ reflected light is polarized parallel to the surface of reflection
H. monochromatic
I. polarization $\qquad$ the slowing of the speed of light in materials with $n>1$
J. reflection
K. refraction $\qquad$ any point on a propagating wavefront acts as the source of new "wavelets"
$\qquad$ the "spreading" of a wave around a corner or an obstacle
2. Which one of the following statements is TRUE?
A. Sunlight is plane-polarized.
B. Sunlight is monochromatic.
C. Rainbows are possible because water is dispersive.
D. Sunlight reflected from the surface of water at Brewster's angle is completely unpolarized.
3. ( 2 pts .) If the index of refraction of visible light in diamond is 2.42 , what is the speed of visible light in diamond?
A. $7.26 \times 10^{7} \mathrm{~m} / \mathrm{s}$
B. $1.24 \times 10^{8} \mathrm{~m} / \mathrm{s}$
C. $1.76 \times 10^{8} \mathrm{~m} / \mathrm{s}$
D. $2.27 \times 10^{8} \mathrm{~m} / \mathrm{s}$
E. $3.00 \times 10^{8} \mathrm{~m} / \mathrm{s}$ (equal to $c$ )
F. $7.26 \times 10^{8} \mathrm{~m} / \mathrm{s}$
4. You are using a big magnifying glass to enlarge a tiny classified ad in the newspaper. Any one of the following would change the magnification of the ad EXCEPT:
A. changing the distance from the ad to the lens
B. changing the curvature of the side of the lens nearest to you
C. changing the curvature of the side of the lens nearest to the newspaper
D. removing 1 cm of glass from around the edge of the lens
E. changing the lens from glass to diamond
$F$. filling the room with water
5. (2 pts.) You see your reflection on the outside of a shiny spherical (convex) Christmas tree ornament. Your reflection appears:
A. upright and enlarged
C. inverted and enlarged
B. upright and shrunken
D. inverted and shrunken
6. All of the following are true EXCEPT:
A. The faster an object's speed is relative to yours, the smaller its mass becomes.
B. No mass can move at the speed of light.
C. No mass can move faster than the speed of light.
D. Anything that moves at the speed of light must have zero mass.
7. Your friend is riding on a very fast train, moving at $80.0 \%$ of $c$. You are standing at rest on the ground right next to the train tracks as it passes by, and you can see each other through the train's window.
a. (2 pts.) During the time that it takes 10.0 seconds to elapse on the clock next to your friend inside the train, how many seconds do you see elapse on your own watch?
A. 10.0 s
B. 12.5 s
C. 14.1 s
D. 16.7 s
E. 18.0 s
F. 28.2 s
b. (2 pts.) You and your friend both have meter-sticks which you measured to be 1.00 meter long before he got on the train. Now, you both hold up your sticks in the direction that the train is moving. What length would you measure your train-riding friend's stick to have?
A. 0.600 m
B. 0.667 m
C. 0.750 m
D. 0.800 m
E. 0.886 m
F. 0.993 m
c. At the same exact time, what length would your train-riding friend measure your stick to have?
A. shorter than your answer to part (b)
B. the same as your answer to part (b)
C. longer than your answer to part (b), but still shorter than 1.00 meter
D. 1.00 meter
E. longer than 1.00 meter

Score: $\qquad$

## FALL 2003 Midterm Exam \#3, Part B

Show your work on all free-response questions. Be sure to use proper units and significant figures in your final answers. Ignore gravity in all problems unless told otherwise, and ignore relativistic effects in non-relativistic problems.

1. You have a rectangular prism of glass ( $n=1.65$; all corners exactly $90^{\circ}$ ). You shine a red laser ( $\lambda_{\text {air }}=632.8 \mathrm{~nm}$ ) from air ( $n=1.00$ ) into the left side of the glass at an incident angle $\theta_{1}=60.0^{\circ}$.
a. ( 8 pts .) Calculate all five of the angles $\boldsymbol{\theta}_{2}$ through $\boldsymbol{\theta}_{\mathbf{6}}$. Show your work! (You will find that some of the angles require little or no new calculation; use very brief explanations in those cases.)

b. ( 5 pts.) Calculate the critical angle between the prism and air. Show your work! Relatedly, briefly explain what happens when the ray hits the top side of the prism, resulting in $\theta_{3}$ and $\theta_{4} \ldots$ what is this phenomenon called?
2. Suppose that monochromatic light from a green laser ( $\lambda_{\text {air }}=555.0 \mathrm{~nm}$ ) is incident on a single narrow slit, and forms an interference pattern on a white wall 15.0 m away from the slit. You use a light meter and find that the resulting pattern has the following intensity as a function of distance (in centimeters) from the center of the pattern:

a. (2 pts.) Label the $m=0,1,2$, and 3 maxima and the $m=1,2$, and 3 minima on the above graph. (You do not need to label both sides; just the right or left side is fine.)
b. (6 pts.) Calculate the width of the slit being illuminated. Show your work clearly.
3. Have you ever wondered what happens when you turn the "focus" knob on a conventional camera? You are adjusting the distance between the lens to the film, so that you can position the film exactly at the image plane for your desired object. Light from an object at a distance $d_{\mathrm{o}}$ "in front of" the lens will form a real image at distance $d_{\mathrm{i}}$ "behind" the lens. So, by turning the focus knob, you are adjusting the lens-film distance until the film is located at exactly $d_{\mathrm{i}}$ from the lens - then the image on the film will be nice and sharp.
a. (3 pts.) Suppose that your camera lens has a focal length of 28.0 mm . You want to focus on a flower 100.0 mm in front of the lens. At what distance $\boldsymbol{d}_{\mathbf{i}}$ behind the lens will the image form? (This is the distance where we want to position the film inside the camera.) Show your work.
b. (3 pts.) What will be the magnification of the flower's image compared the actual flower? (Watch your signs!)
c. (3 pts.) If the actual flower is 75 mm across, will its entire image fit within a $35-\mathrm{mm}$ tall piece of film? Show your work.
d. (4 pts.) On the diagram below, show than an object located 100 mm to the left of the lens will form a real image at the position you calculated in part (a). Trace at least two of its principal rays. LABEL the object and image. Use an object of any height you wish, and observe the scale of 10 mm per division. (Does your resulting magnification agree with your answer to part (b)? It should.)
