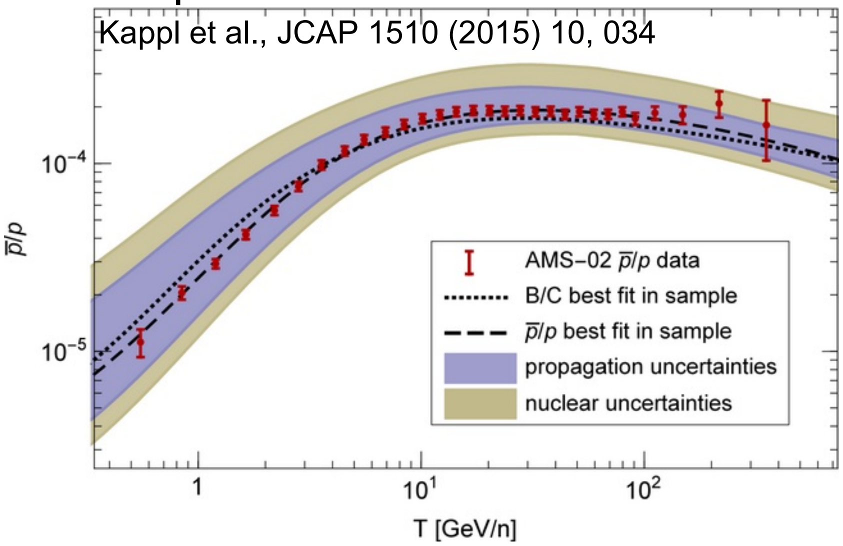
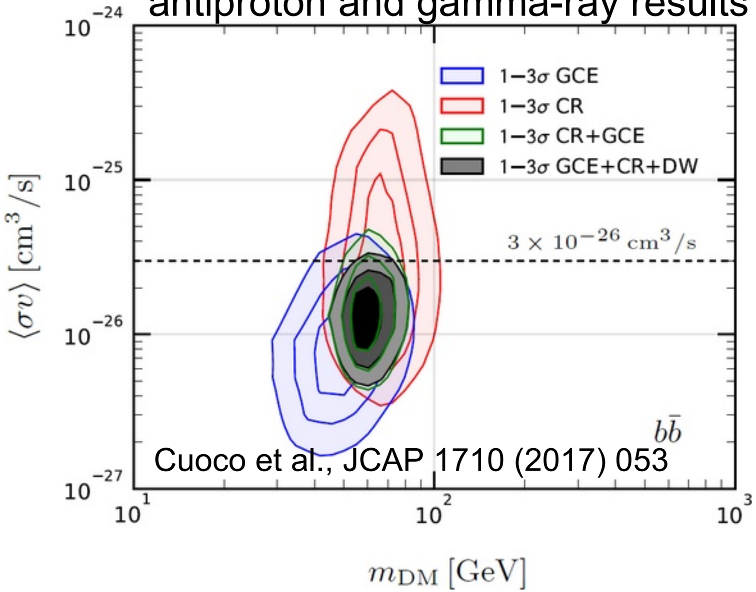
Unexplained features in cosmic rays

antiproton



antiproton and gamma-ray results



- combined fit with antiproton and diffuse gamma-rays from the Galactic Center → 80GeV DM particle (ongoing debate)

- unexplained feature in positrons:
  - astrophysical origin → pulsars
  - SNR acceleration
  - dark matter annihilation

- **understanding astrophysics background is a challenge** → better constraints on cosmic-ray propagation and astrophysical production are needed

Status Cosmic-ray Antinuclei Searches

- **Potential $\bar{p}$ excess** in AMS-02 data above secondary background predictions at R~10 GV was found in various studies
  → significance level unclear

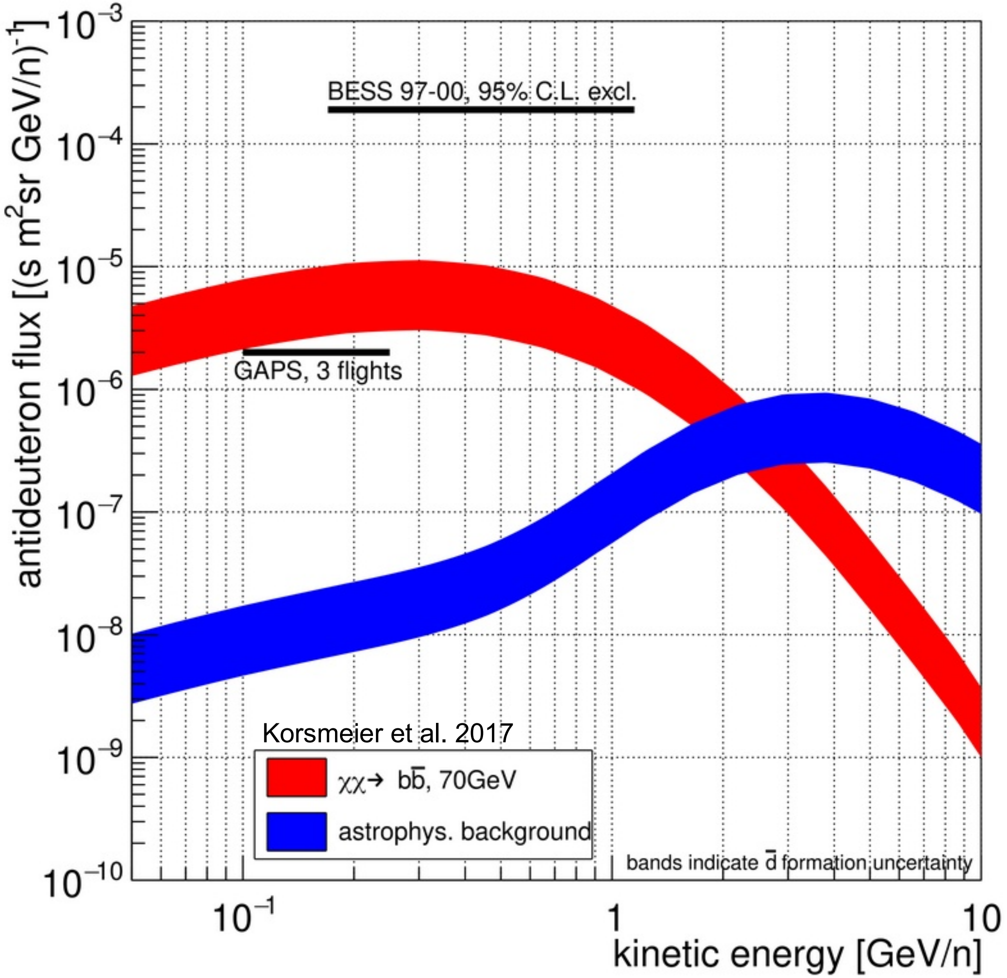
- AMS-02 reported at conferences the observation of **antihelium candidates (~1/year)**
  → interpretations are actively ongoing

- **Possible physics models that explain antihelium candidates include:**
  - Secondary astrophysical background
  - Dark matter annihilation or decay
  - Nearby antistar: at distance of ~1pc

- **No explanation of antiproton nor antihelium should overproduce antideuterons relative to existing limits**

- **Search for antinuclei with independent technique is critical**

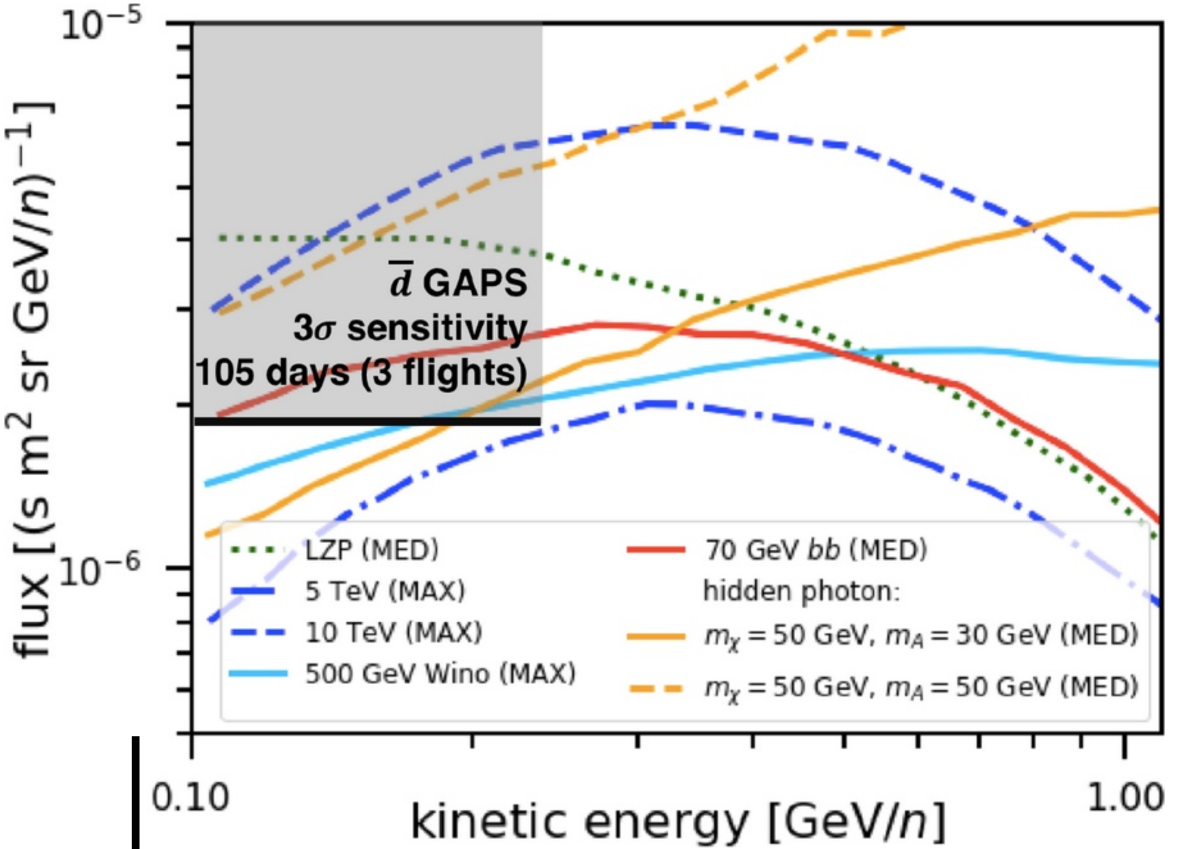
- Review based on 2nd Cosmic-ray Antideuteron Workshop: "Cosmic-ray Antinuclei as Messengers of New Physics: Status and Outlook for the New Decade" [JCAP08(2020)035, arXiv:2002.04163]



Antideuteron model sensitivity

T. Aramaki et al., Astropart. Phys. 74, 6 (2016)

- **Low-energy antideuterons are essentially free of astrophysics background**
- **Wide range of dark matter models**, e.g.:
  - Generic 70GeV WIMP annihilation model that explains antiproton excess and γ-rays from Galactic center
  - Dark matter gravitino decay
  - Extra dimensions
  - Heavy DM models with Sommerfeld enhancement
  - Dark photons (inaccessible to other techniques)
  - Selection of publications:
    Braeuninger et al. Physics Letters B 678, 20–31 (2009)
    Cui et al, JHEP 1011, 017 (2010)
    Hryczuk et al., JCAP 1407, 031 (2014).
    Korsmeier et al., Physical Review D 97, 103011 (2018)
    Randall & Xu, JHEP (2020)



astrophysics background at ~10^{-7}–10^{-8}(s m^2 sr GeV/n)$^{-1}$

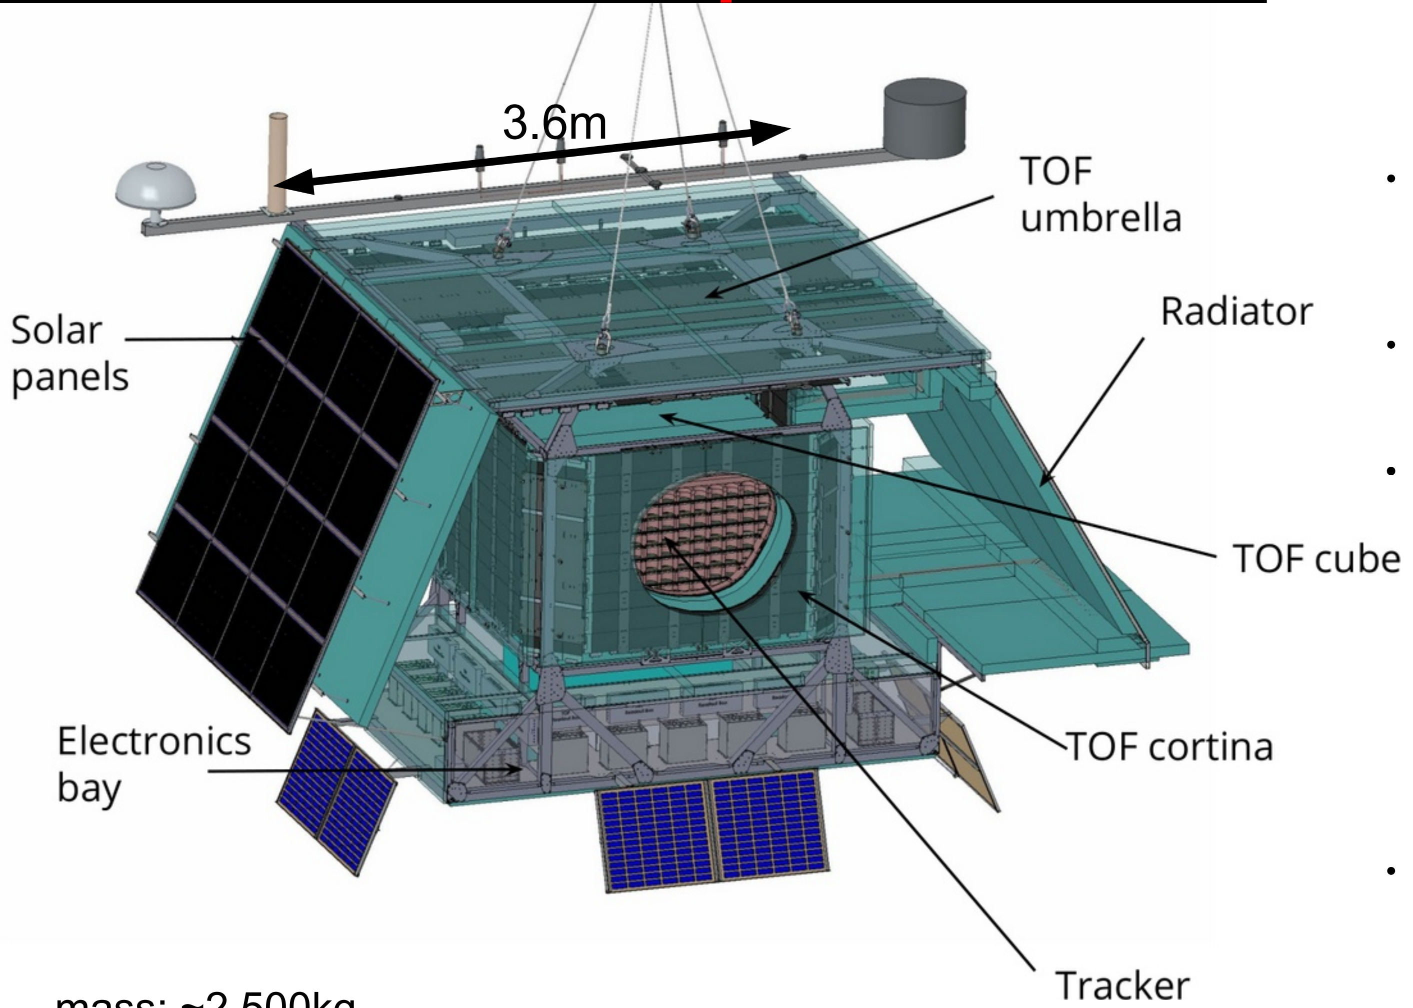
Antideuteron Workshops at UCLA

2014

2019

organized with Rene Ong

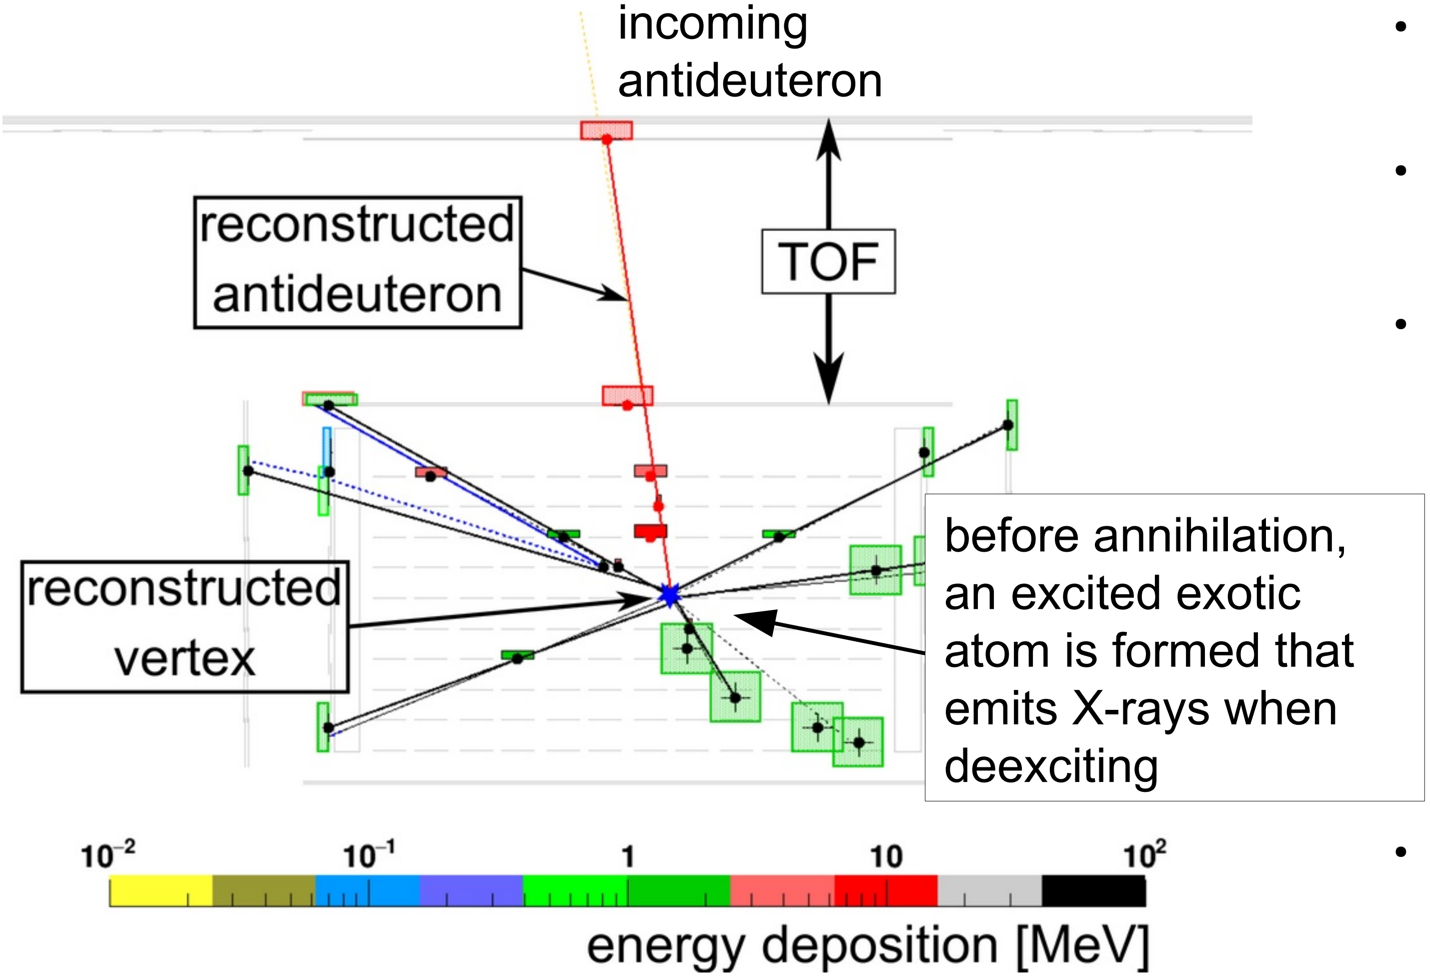
The GAPS experiment



mass: ~2,500kg
power: 1.3kW

- The **G**eneral **A**nti**P**article **S**pectrometer is the first experiment dedicated and optimized for low-energy cosmic-ray antinuclei search
- Requirements: long flight time, large acceptance, large identification power
- **GAPS will deliver:**
  - a precision antiproton measurement in an unexplored energy range <0.25 GeV/n
  - antideuteron sensitivity 2 orders of magnitude below the current best limits, probing a variety of DM models across a wide mass range
  - leading sensitivity to low-energy cosmic antihelium nuclei
- **GAPS is under construction, preparing for first Antarctic Long Duration Balloon flight in December 2023**

GAPS principle



- antiparticle slows down and stops in material
- near-unity chance for creation of an excited exotic atom (E_{kin}~E_{I})
- deexcitation:
  fast ionization of bound electrons (Auger)
  → complete depletion of bound electrons
  Hydrogen-like exotic atom (nucleus+antideuteron) deexcites via characteristic X-ray transitions depending on antiparticle mass
- Nuclear annihilation with characteristic number of annihilation products

Antiproton sensitivity

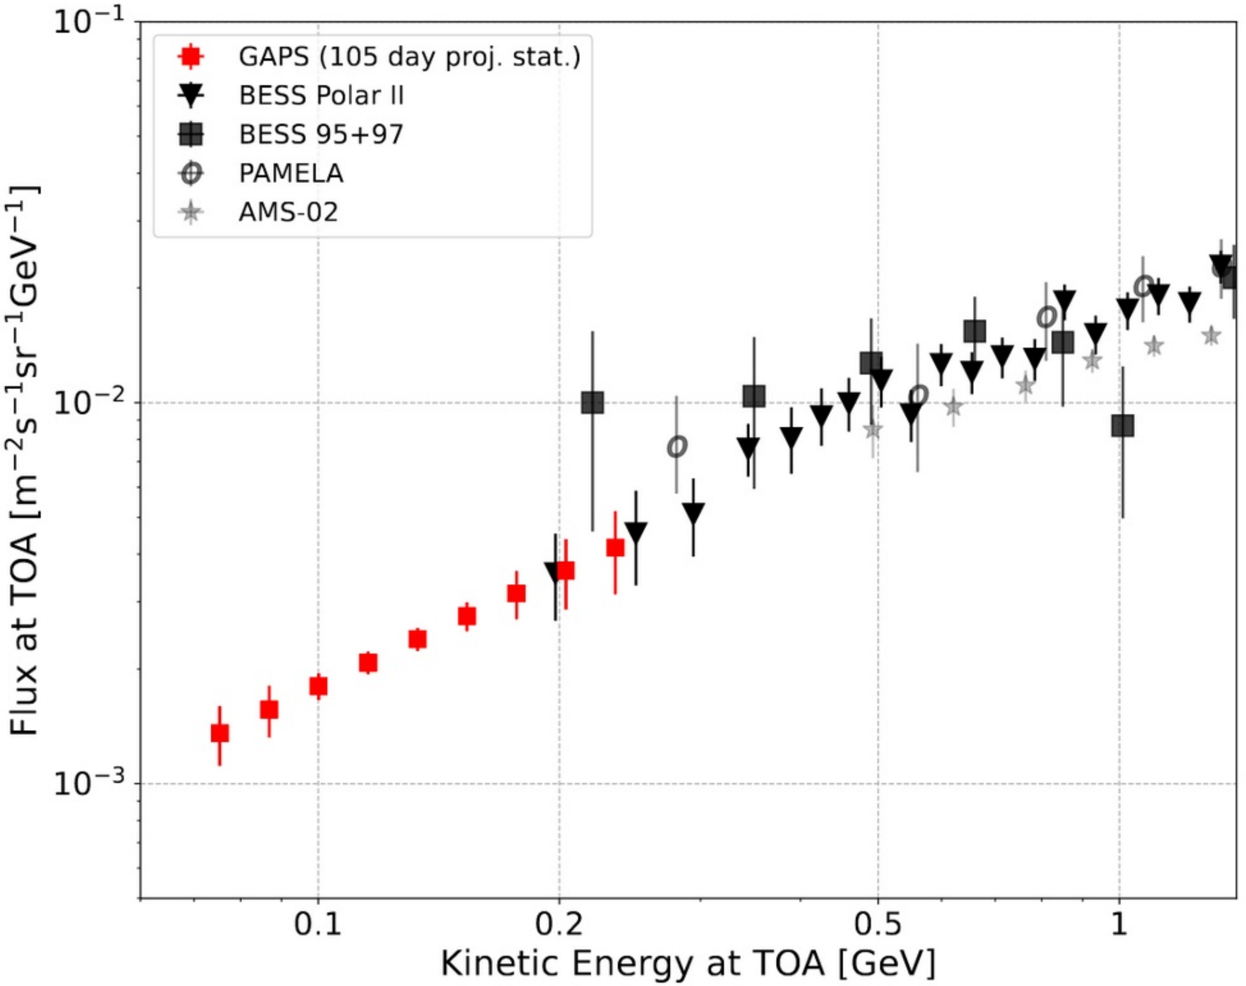
F. Rogers et al., Astropart. Phys. 145, 102791 (2022)

- Precision antiproton spectrum in unexplored low-energy range (<0.25 GeV/n): ~500 antiprotons for each long-duration balloon flight

- Validation of technique:
  - First cosmic rays detected with the exotic atom method
  - Reconstruction of annihilation signature
  - X-rays from exotic atom deexcitation
  - Test models for atmospheric effects

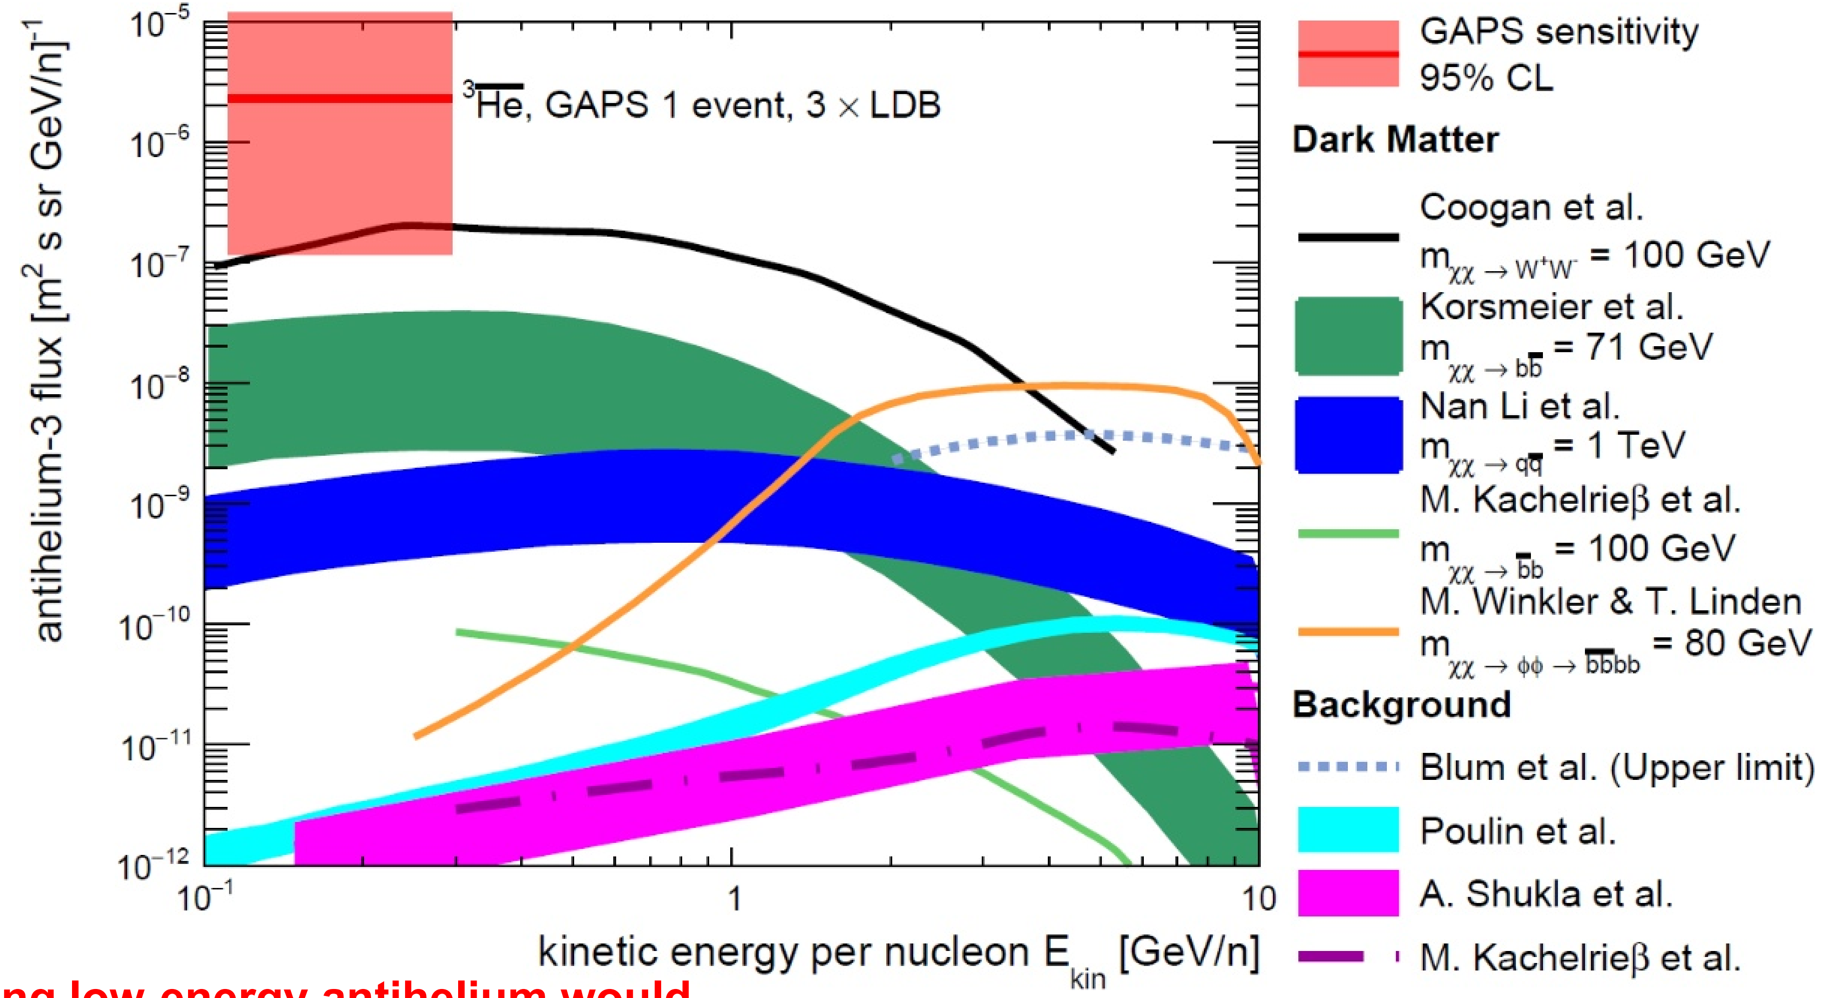
  → Reduces the systematic uncertainties for antideuteron search

- Probe light dark matter models and primordial black hole evaporation



Antihelium-3 sensitivity

N. Saffold et al., Astropart. Phys. 130, 102580 (2021)



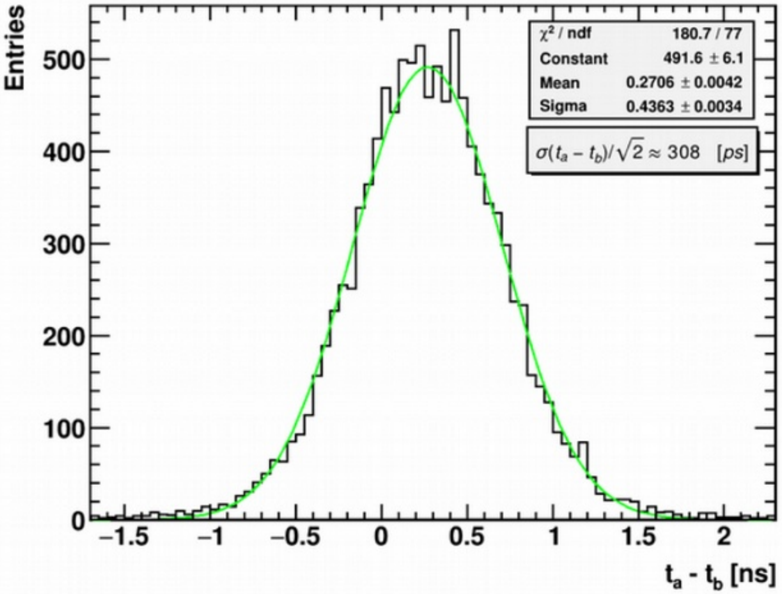
Finding low-energy antihelium would be truly revolutionary new physics

Time-of-Flight

- Tasks:
  - main trigger system, special antinuclei trigger achieves a manageable rate of ~500 Hz (down from 200 kHz individual TOF paddle rate)
  - Tracking of incoming (anti)particles and velocity measurement

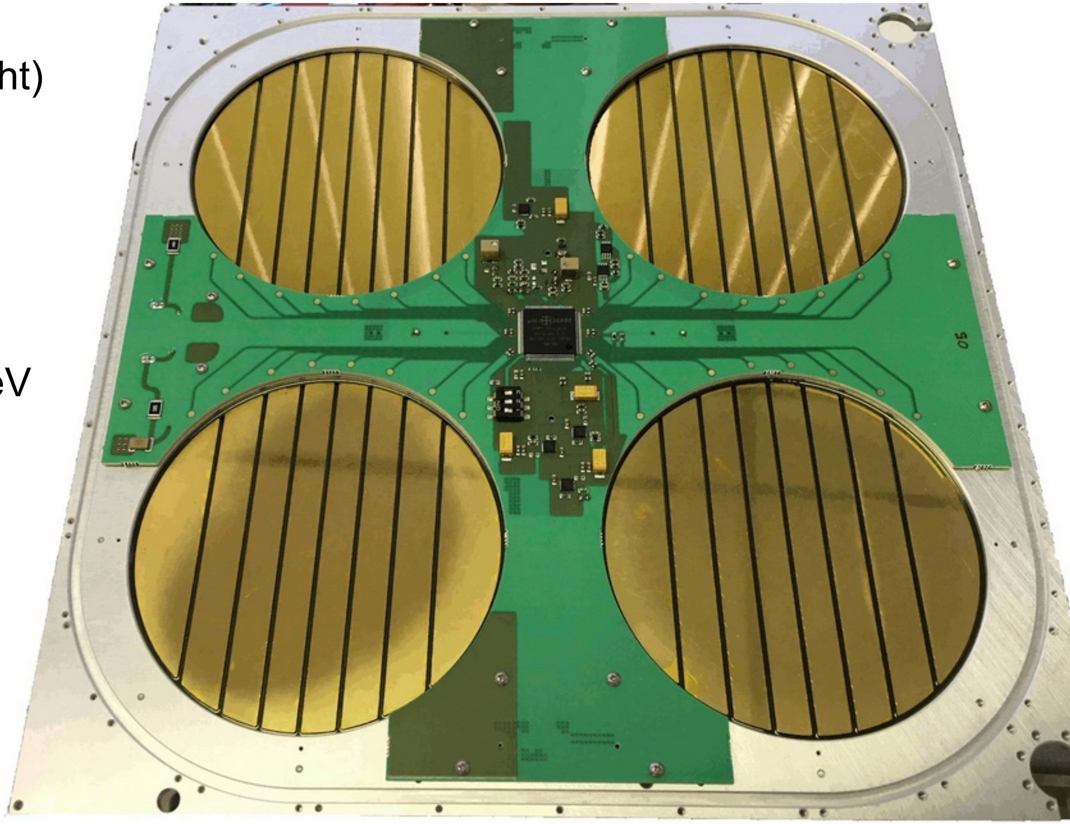
- Plastic scintillator (Eljen EJ-200: 160-180cm long, 0.6 cm thick) with 6 SiPMs per end (Hamamatsu S13360-6050VE)

- fast sampling with custom-made readout board, based on the DRS-4 ASIC: <400ps timing resolution achieved in test paddles (end-to-end time difference) and in GAPS functional prototype (GFP).

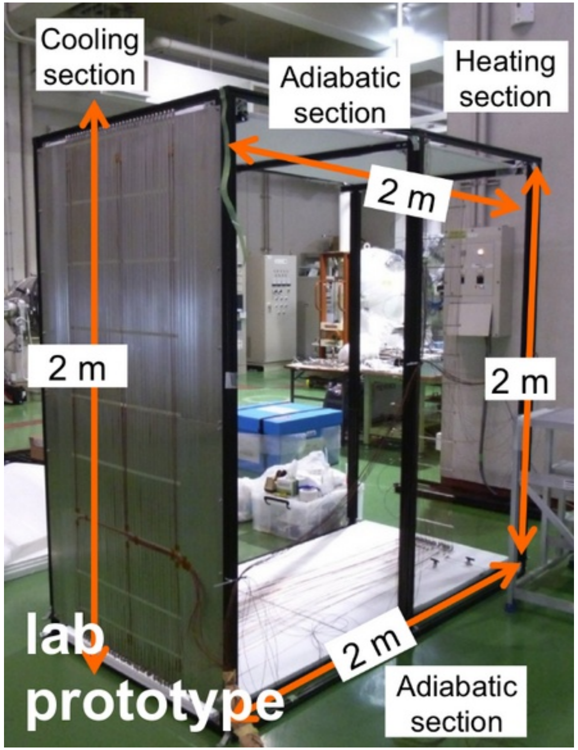


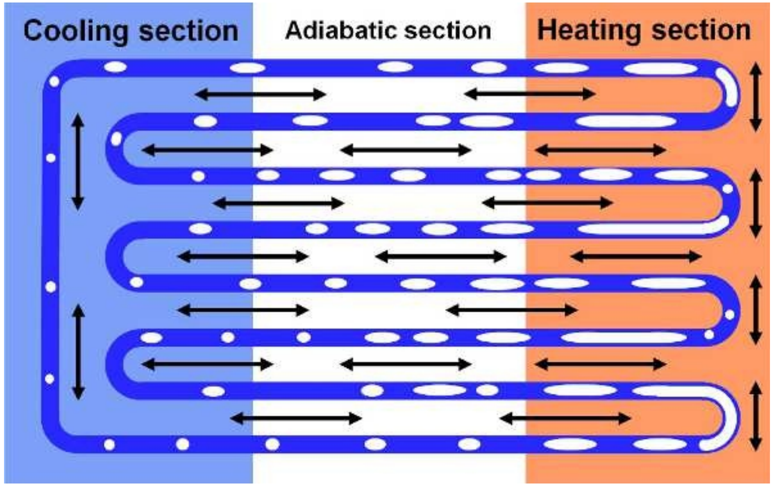
Tracker

- Tracker acts as target and tracking device
- GAPS can accommodate 1,440 4” Si(Li) detectors, 2.5mm thickness (1109 detectors calibrated for first flight)
- Operation at temperature of –35C to –45C, cooling system will use novel OHP approach
- Readout via custom ASIC: integrated low-noise preamplifier with large dynamic range: 10keV to 100MeV
- Publications:
  - Perez et al., NIM A 905, 12 (2018)
  - Kozai et al., NIM A 947, 162695 (2019)
  - Rogers et al., JINST 14, P10009 (2019)
  - Saffold et al., NIM A 997, 165015 (2021)
  - Manghisoni et al., IEEE 68 (11), 2661 (2021)
  - Kozai et al., NIM A 1034, 166820 (2022)
  - Xiao et al., in preparation (2023)
  - Roach et al., in preparation (2023)

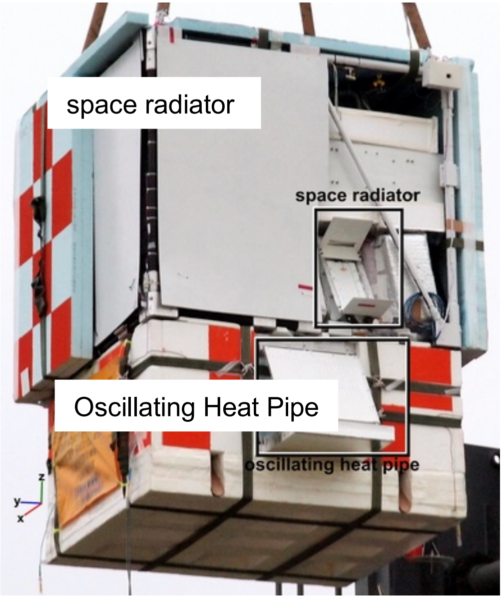


Oscillating heat pipe cooling system





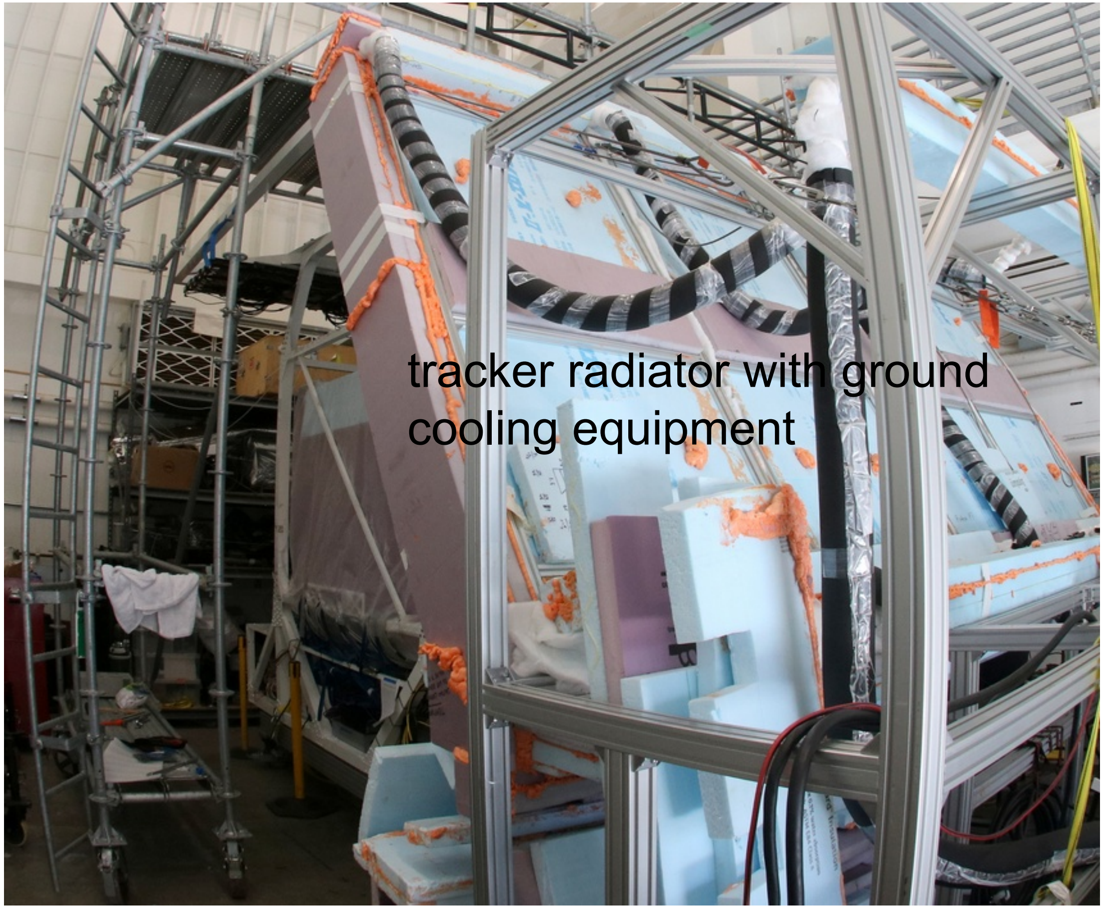
2012 prototype



- passive cooling approach developed at JAXA/ISAS:
- small capillary metal tubes filled with a phase-changing refrigeration liquid
- small vapor bubbles form in the fluid
  → expand in warm sections/contract in cool sections
- rapid expansion and contraction of these bubbles create thermo-contraction hydrodynamic waves that transport heat
- no active pump system is required
- First prototype was flown in 2012 and another prototype was flown from Ft. Sumner in 2019

Okazaki et al., J. Astr.. Instr. 3 (2014)
Fuke et al., J. Astron. Instrum. (2017)
Okazaki et al., Appl. Therm. Eng. (2018)
Fuke et al., NIM A 1049, 168102 (2023)

Integration status 3/23

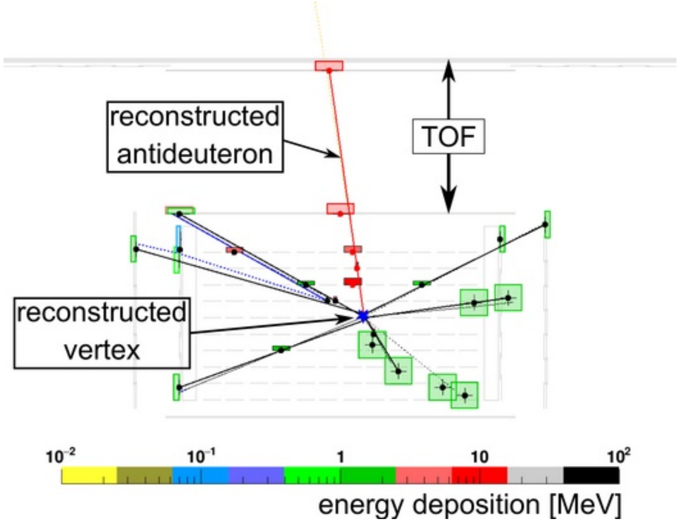


Timeline

- Integration and systems testing in spring 2023
- Thermal vacuum and compatibility testing summer 2023
- **First flight in Dec. 2023 from McMurdo, Antarctica**

Image credit: NASA (cropped)

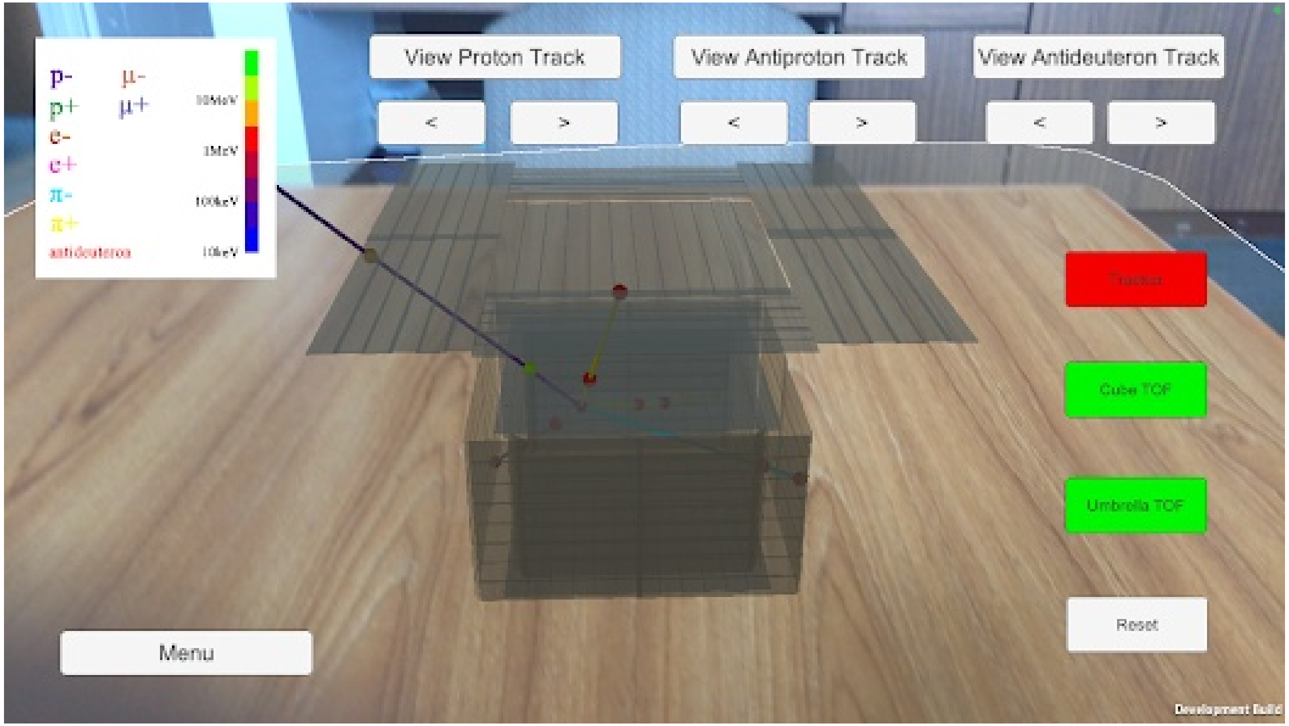
GAPS path forward



- **GAPS will deliver:**
  - a precision antiproton measurement in an unexplored energy range <0.25 GeV/n
  - antideuteron sensitivity 2 orders of magnitude below the current best limits, probing a variety of DM models across a wide mass range
  - the only complementary probe of the AMS-02 antinuclei signal

- GAPS instrument integration is ongoing → **first flight in austral summer 2023**

GAPSimulator AR app



Get it on the PlayStore and App store → search for “GAPSimulator“
